

Lecture: 32 - LLM Finetuning

Approaches

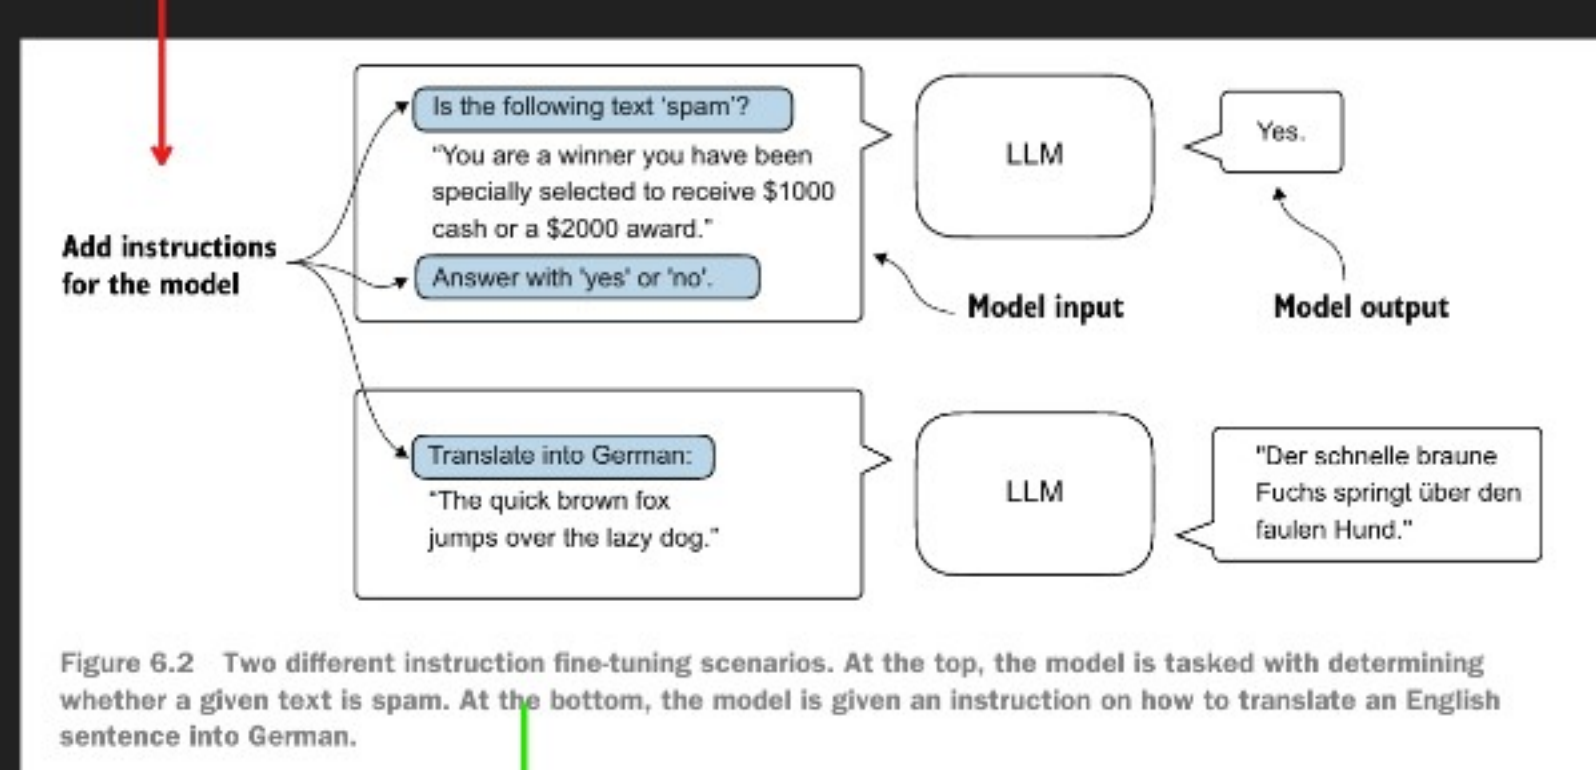

Finetuning: Adapting a pretrained model to a specific task by training the model on additional data.

Instruction finetuning

Classification finetuning

Training a language on a set of task using specific instruction.

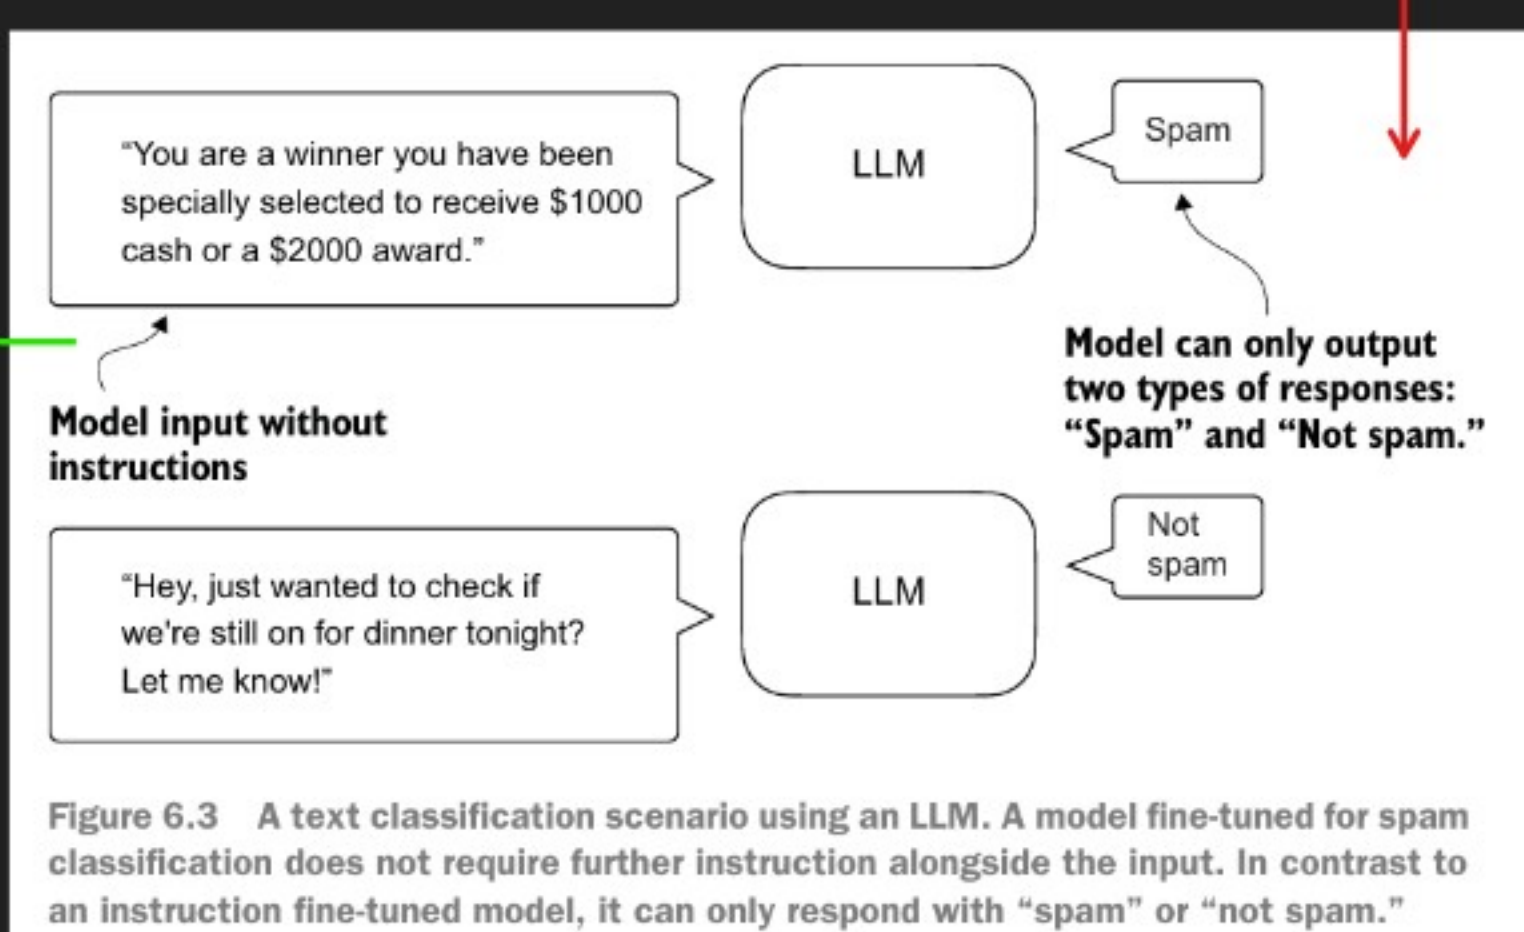

Model is trained to a specific set of labels, such as spam

Can handle broader set of tasks.

Larger dataset, greater computational power needed

Can handle narrow set of prompts

Let us work on finetuning classification problem:
