

lecture-30: loading + saving

PyTorch model weight

(1) let us learn to save and load a pretrained model.

```
* torch.save(model.state_dict(), 'model.path')
```

* { dictionary
mapping
each layer
to its parameter

file name

```
* model.load_state_dict(torch.load("model.path"))
```

(2) saving optimizer state is also recommended.

optimizer-state-dict

hyper-
parameter

historical data
such as
past gradient.
